

**ABSTRACT SYMPOSIUM NAME:** 3rd Symposium on Poly(2-Oxazoline)s & Polypeptoids-Oral

**ABSTRACT SYMPOSIUM PROGRAM AREA NAME:** POLY

**CONTROL ID:** 2494965

**PRESENTATION TYPE:** Oral Only : Do not consider for Sci-Mix

**TITLE:** Model-based design of the microstructure of individual copoly(2-oxazoline) chains

**AUTHORS (FIRST NAME, LAST NAME):** Paul H. Van Steenberge<sup>1</sup>, Bart Verbraeken<sup>1</sup>, Marie-Françoise Reyniers<sup>1</sup>, Richard Hoogenboom<sup>1</sup>, Dagmar D'hooge<sup>1</sup>

**INSTITUTIONS (ALL):**

1. Ghent University, Gent, Belgium.

**ABSTRACT BODY:**

**Abstract:** To enhance to understanding of copolymerization kinetics and the impact of the synthesis conditions on the polymer microstructure advanced modeling techniques such as kinetic Monte Carlo (*kMC*) simulations are a powerful tool.<sup>1,2,3</sup> In the present contribution, the potential of *kMC* simulations to design the comonomer incorporation in the synthesis of well-defined copoly(2-oxazolines) via cationic ring-opening polymerization (CROP) is illustrated. Based on a comparison with an extensive set of polymerization data, the model parameters are optimized.<sup>4</sup> Both the synthesis of steep gradient copolymers and copolymers with precision control on side-group functionality are considered. It is specifically highlighted that modeling allows to visualize all the comonomer sequences for each individual chain (see figure; target degree of polymerization (target DP): 50, 100, 200, and 400), offering a strong support toward experimental characterization techniques and therefore opening the pathway of the full exploitation of the CROP technique.
